TRADE WITH JOREEM

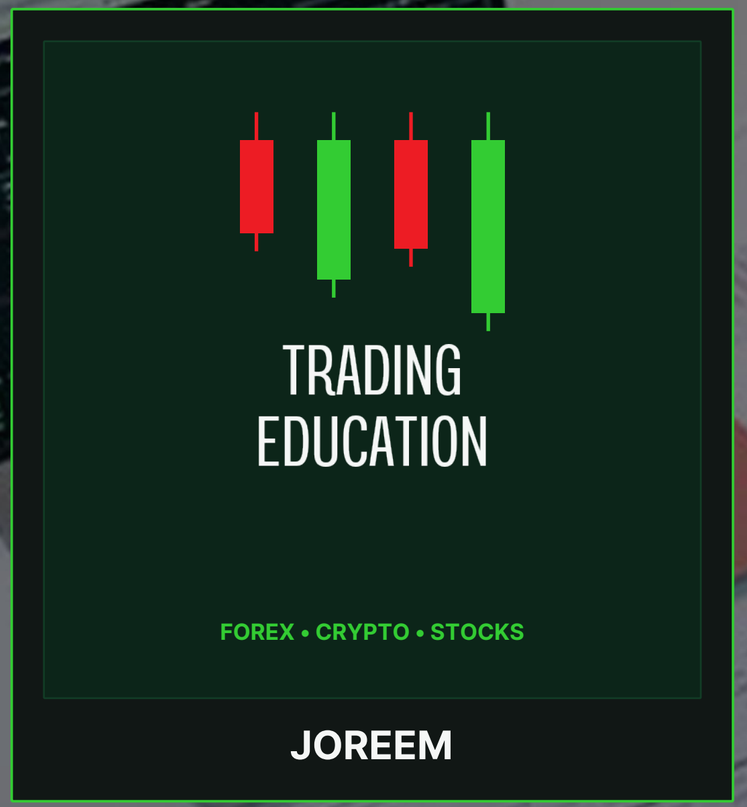

JOREEM LEARNING SERIES • COURSE 02

COMPLETE SUPPLY & DEMAND TRADING COURSE

Read momentum • Mark zones • Wait for confirmation • Add confluence

3 ZONE METHODS | ENTRY WALKTHROUGHS | FIB CONFLUENCE

A practical, chart-led course built from the supplied transcript.

LEARN THE PROCESS.
RESPECT THE RISK.

EDUCATIONAL ONLY • TRADING INVOLVES RISK • NO RETURNS ARE GUARANTEED

WHAT YOU WILL LEARN

A direct progression from spotting momentum to planning a confluence trade.

01

Read momentum

Understand aggressive buying and selling, and distinguish strong candles from weak overlap.

FOUNDATION

02

Mark zones three ways

Use momentum departures, consolidation and repeated wick rejection.

LOCATION

03

Trade the retest

Compare pending orders with manual confirmation, then define entry, stop and target.

EXECUTION

04

Stack confluence

Combine demand with Fibonacci retracement and a clear confirmation response.

REFINEMENT

KEY TAKEAWAY The method is rinse-and-repeat only when the rules remain the same.

PART 01 • READ MOMENTUM

Supply and demand begin with aggressive directional pressure.

01

START WITH THE CANDLES

MOMENTUM BEFORE MARKUP

The course looks for strong buying or selling that can reveal decisive participation, rather than marking every small pause on the chart.

1. Spot directional pressure
2. Avoid tiny-candle ambiguity
3. Use zones as reaction areas

PRESSURE → ZONE → REACTION

WHAT SUPPLY & DEMAND LOOK LIKE

In this course, the first clue is a series of large, directional momentum candles.

1. **Demand**
   Aggressive buying drives price upward with strong bullish candles.

2. **Supply**
   Aggressive selling drives price downward with strong bearish candles.

3. **Weak contrast**
   Small, overlapping candles provide less evidence of decisive pressure and are not the preferred departure.

MOMENTUM IS EVIDENCE OF PRESSURE — NOT PROOF OF WHO PLACED EACH ORDER.

WHY TRADERS WATCH THESE AREAS

The aim is to respond where strong pressure previously appeared — without treating the story as certainty.

01

Participation

Large directional candles can show that one side temporarily controlled the auction.

READ THE FOOTPRINT

02

Reaction, not prediction

A zone tells you where to watch; it does not tell you that price must reverse.

WAIT FOR EVIDENCE

03

Defined decisions

A marked area makes entry, invalidation and target easier to plan consistently.

PLAN THE RISK

KEY TAKEAWAY

Retail traders cannot move the market like large participants — but they can choose when not to trade.

PART 02 • THREE WAYS TO MARK ZONES

Momentum, consolidation and wick rejection.

02

BUILD THE AREA OF INTEREST

THREE FOOTPRINTS. ONE PURPOSE.

Each method identifies an area where price previously paused, rejected or departed with force.

1. Find at least three momentum candles
2. Box meaningful consolidation
3. Respect repeated wick rejection

DRAW • PROJECT • WAIT FOR THE RETURN

METHOD 01 • MOMENTUM DEPARTURE

The course's primary drawing rule uses at least three momentum candles in a row.

01 — Spot the sequence

Find three or more strong candles driving in the same direction.

02 — Find the origin

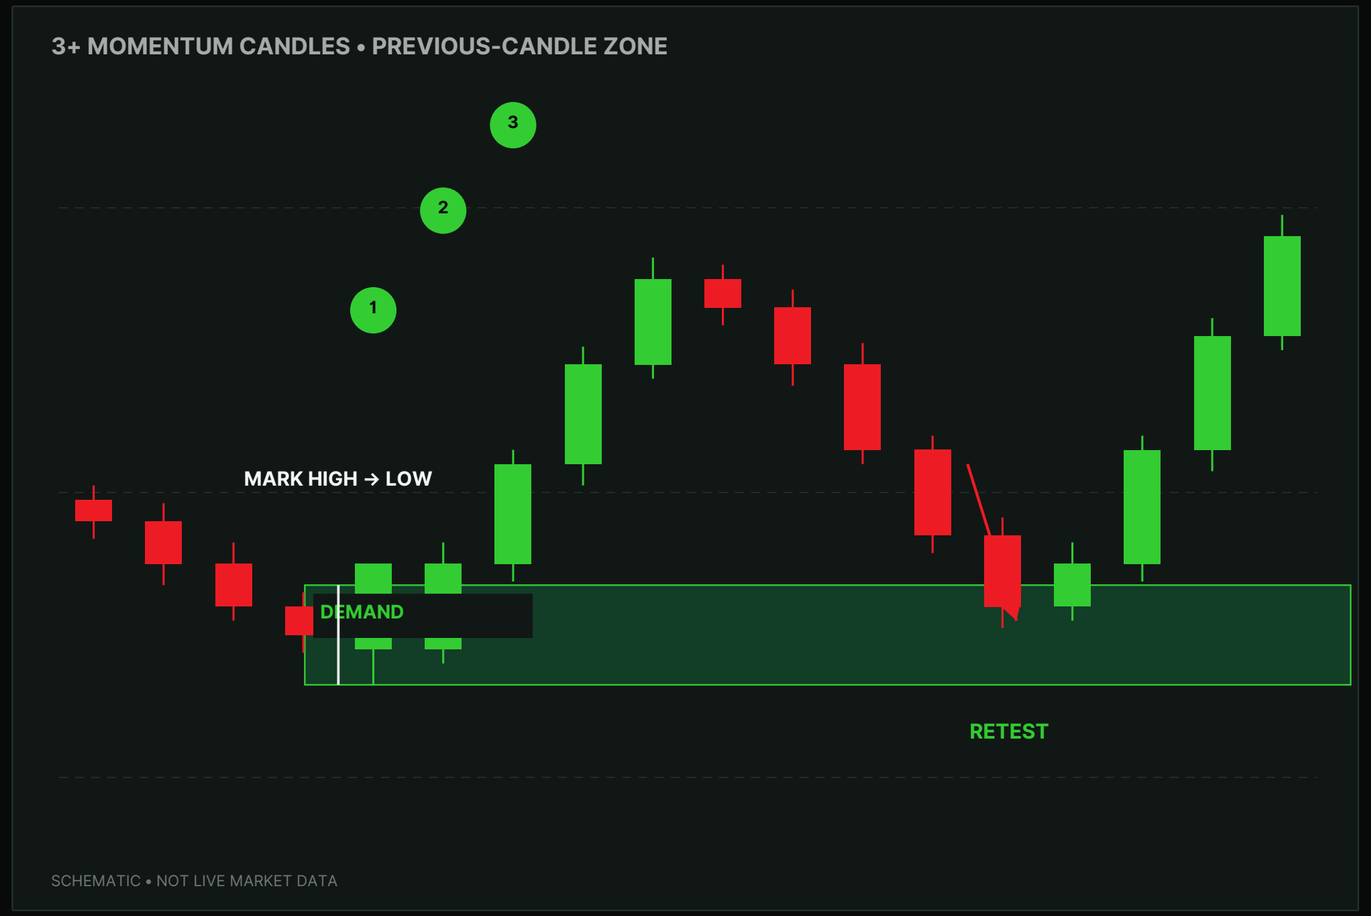

Select the candle immediately before the impulsive sequence.

03 — Mark high to low

Box the previous candle's complete range and extend it right.

04 — Wait for the retest

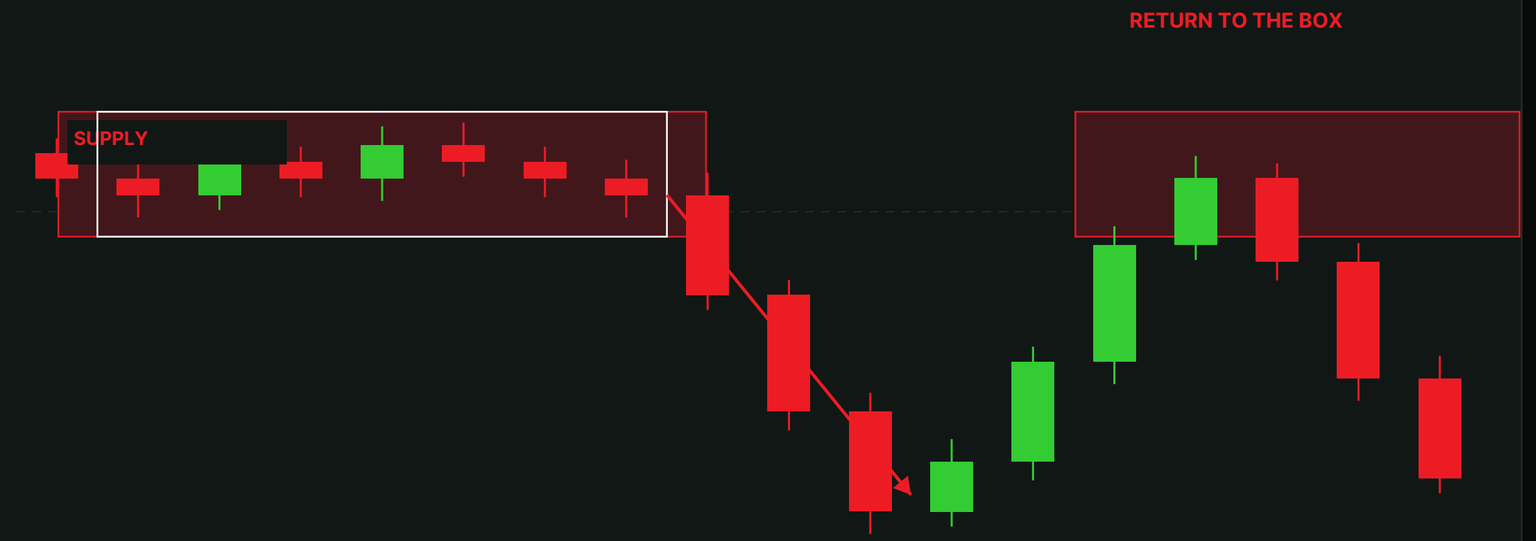

Demand follows a strong up-move; supply follows a strong down-move.

METHOD 02 • CONSOLIDATION

Box the sideways area and watch how price behaves when it returns.

CONSOLIDATION → EXPANSION → RETEST

SCHEMATIC • NOT LIVE MARKET DATA

READ THE BOX

1. **Identify**
   A clear sideways patch where price makes little net progress.

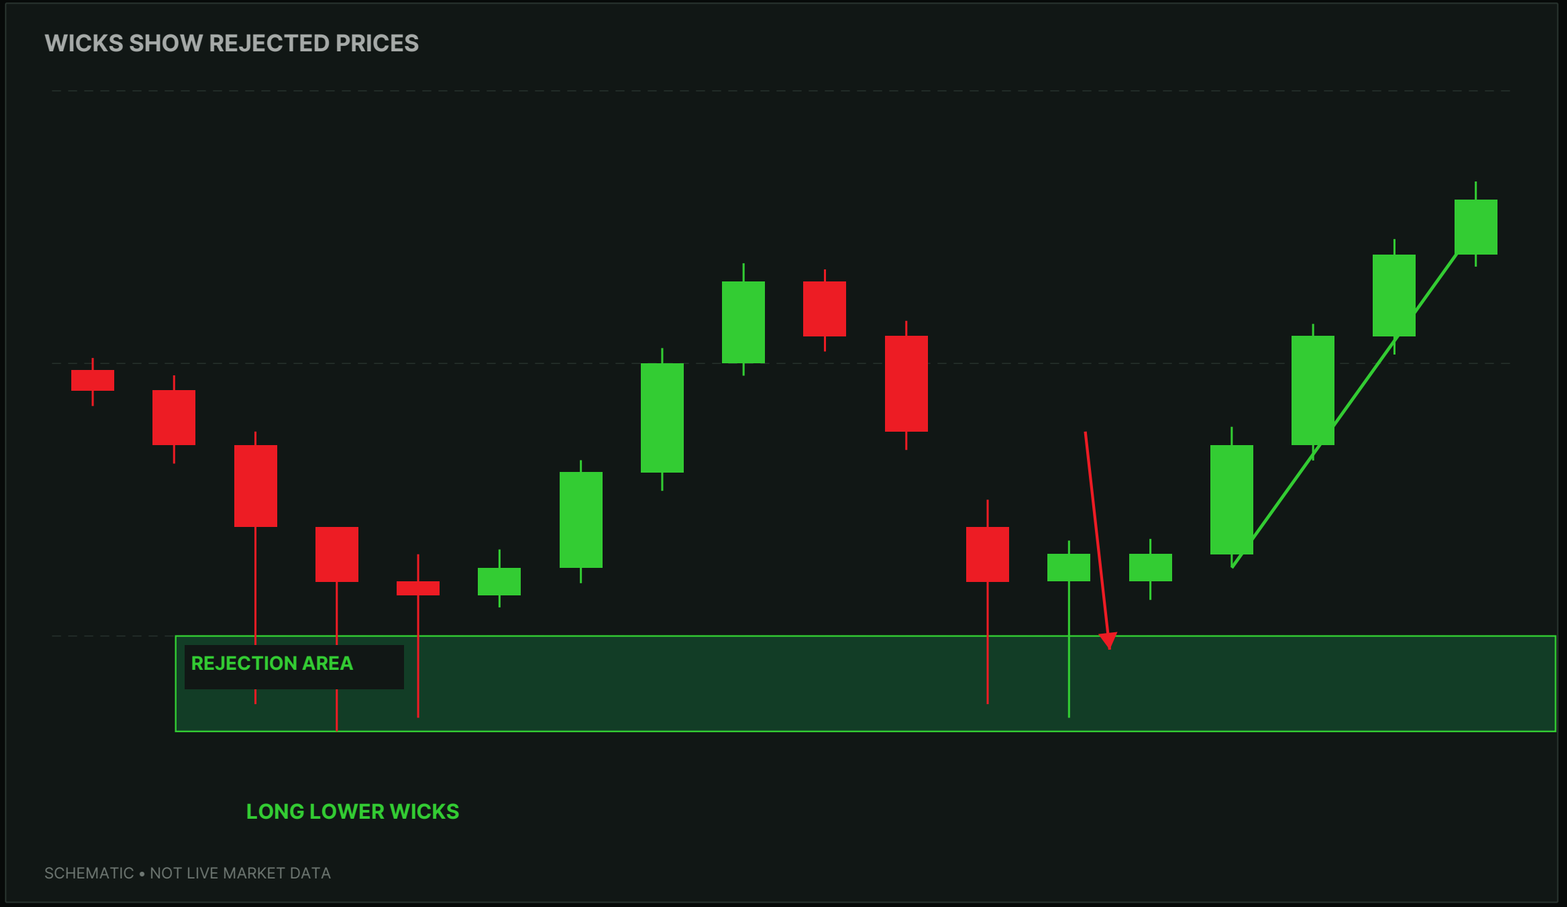

2. **Project**
   Extend the consolidation range into future price action.

3. **Observe**
   The source example treats a return into the box as a potential supply reaction.

Do not assume every consolidation will hold; wait for the response.

METHOD 03 • WICK REJECTION

Multiple long wicks can mark an area where prices were repeatedly rejected.

READ THE WICKS

1. **Cluster**
   Look for several long wicks rejecting a similar price area.

2. **Box**
   Mark the rejection region rather than a single exact price.

3. **Confirm**
   A later return still requires evidence before a manual entry.

Lower wicks illustrate demand rejection here; upper wicks can illustrate supply.

PART 03 • FROM ZONE TO TRADE

Choose an entry style, wait for evidence and define the exit.

03

PATIENCE AT THE RETEST

THE TOUCH IS NOT THE TRIGGER

The course's preferred manual method waits for rejection and then a stronger directional candle before entry.

1. Compare limit and manual entries
2. Wait for bullish or bearish confirmation
3. Place stop and target with structure

RETEST → REJECT → CONFIRM → PLAN

TWO WAYS TO ENTER A RETEST

The transcript presents both, while stating a preference for manual confirmation.

PENDING ORDER

Let the broker enter when price reaches the zone.

1. **Advantage**
   The entry does not require watching every candle at the zone.
2. **Risk**
   Price can trade straight through without showing rejection.
3. **Best practice**
   Predefine position size and invalidation before placing the order.

MANUAL CONFIRMATION

Observe the return and enter only after evidence.

1. **Advantage**
   Rejection and follow-through can filter some failed zones.
2. **Trade-off**
   The entry may be later, or the move may leave without you.
3. **Best practice**
   Define exactly which candle response qualifies as confirmation.

KEY TAKEAWAY No matter how strong a zone appears, price can break it.

THE CONFIRMATION SEQUENCE

A touch begins the observation; it does not complete the setup.

01

Wait for the return

Let price reach the marked demand or supply area.

02

Read rejection

A long-wick doji or multiple rejection wicks show indecision at the area.

03

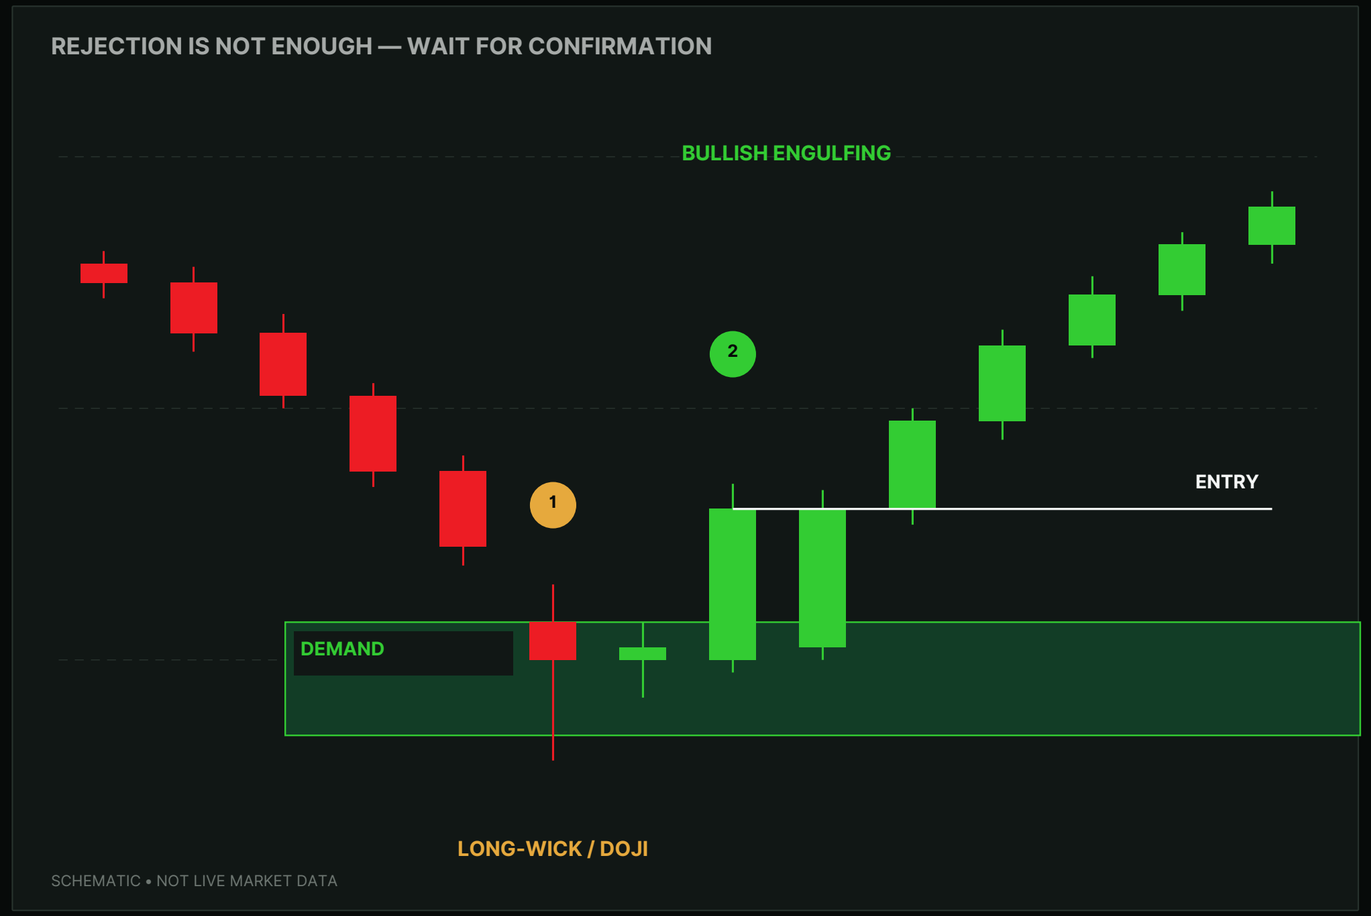

Wait for follow-through

The bullish example uses a strong bullish engulfing candle after rejection.

04

Enter only after confirmation

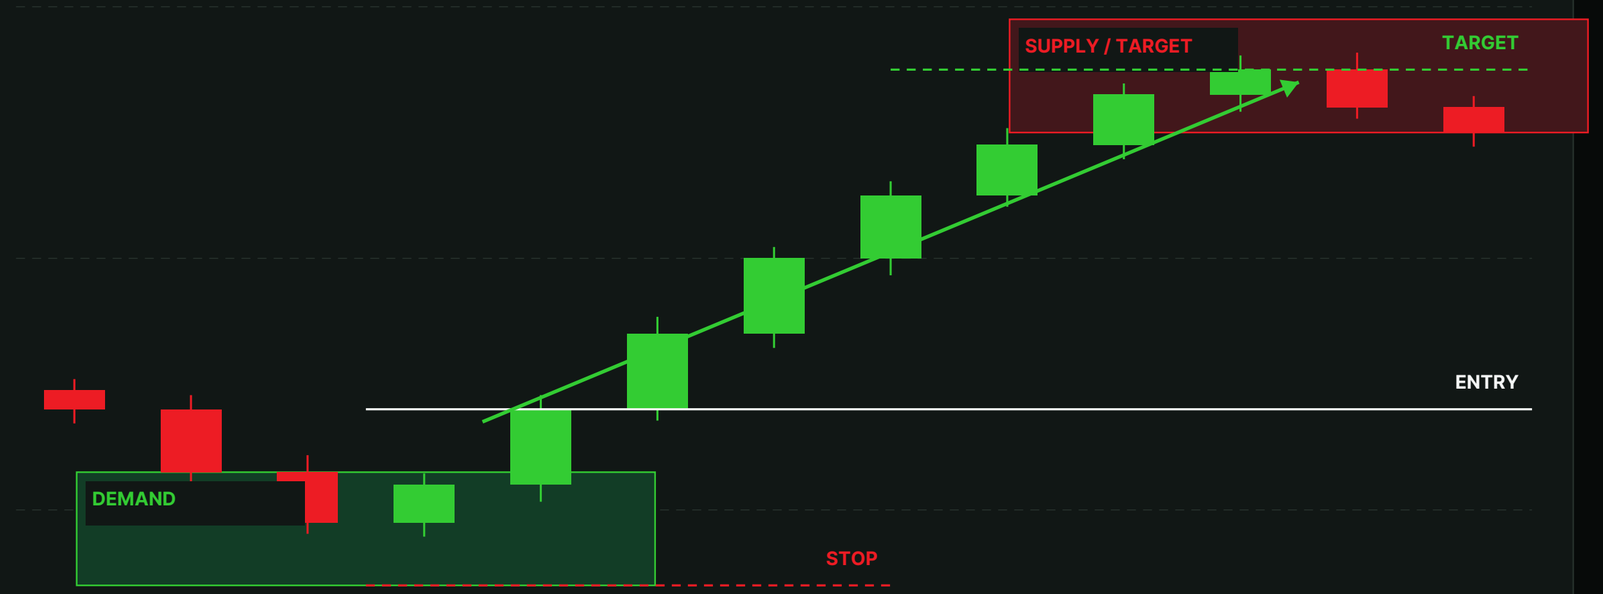

The next candle or candles must support the intended direction; then apply the risk plan.

WORKED LONG: DEMAND TO SUPPLY

A complete plan using the course's confirmation-first example.

DEFINE THE PLAN BEFORE ENTRY

SCHEMATIC • NOT LIVE MARKET DATA

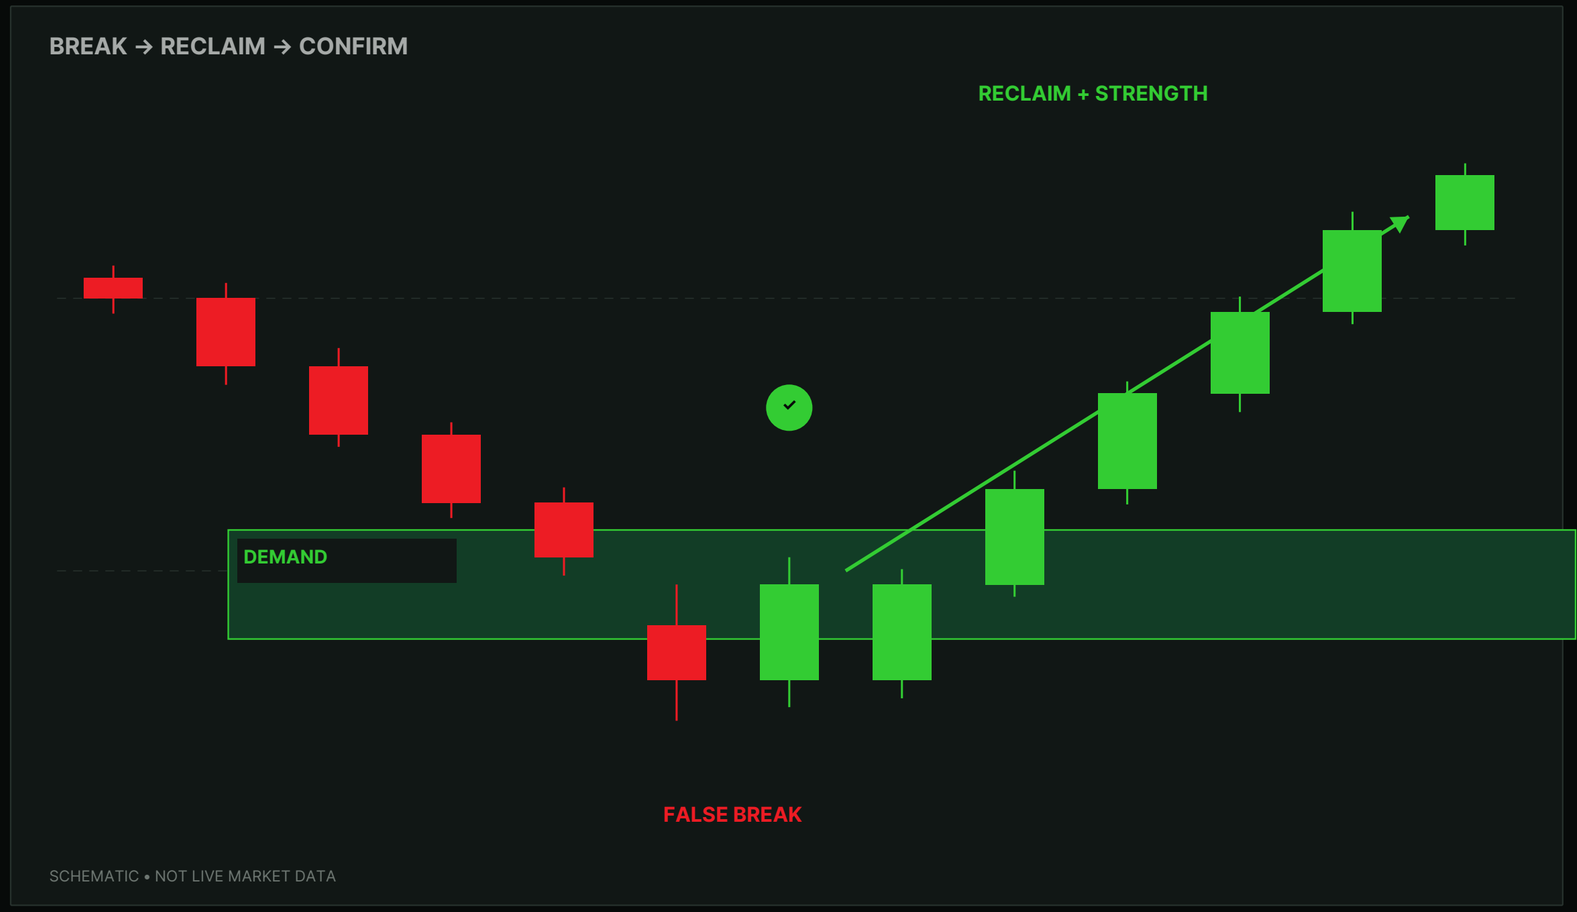

EXAMPLE TICKET

ENTRY	After bullish confirmation
STOP	Below HL or zone
TARGET	Opposing supply
TRIGGER	Rejection + engulfing
GUARANTEE	None

The source shows both a tighter structural stop and a safer stop below the full zone. Test the trade-offs rather than choosing arbitrarily.

FAKEOUT, RECLAIM & ZONE MAINTENANCE

A brief break is not automatically a short signal; the source waits for renewed strength.

WHAT TO WATCH

1. **Do not chase**
   A small break below demand can reverse before follow-through.

2. **Wait for the reclaim**
   Growing bullish candles provide the source example's confirmation.

3. **Redraw after invalidation**
   Once price breaks convincingly through a zone, remove it and remap fresh areas.

A fakeout is only obvious in hindsight; define the reclaim rule before entry.

PART 04 • FIBONACCI CONFLUENCE

Add an independent location tool without abandoning confirmation.

04

THE COURSE'S ADDITIONAL FILTER

WHEN 61.8% MEETS DEMAND

The final section combines a Fibonacci retracement with an existing demand zone and waits for a confirmed response.

1. Map swing low to swing high
2. Watch key retracement levels
3. Require zone + level + response

LOCATION + CONFLUENCE + CONFIRMATION

STACK FIBONACCI WITH THE ZONE

Confluence is useful when each component is defined before price reaches the area.

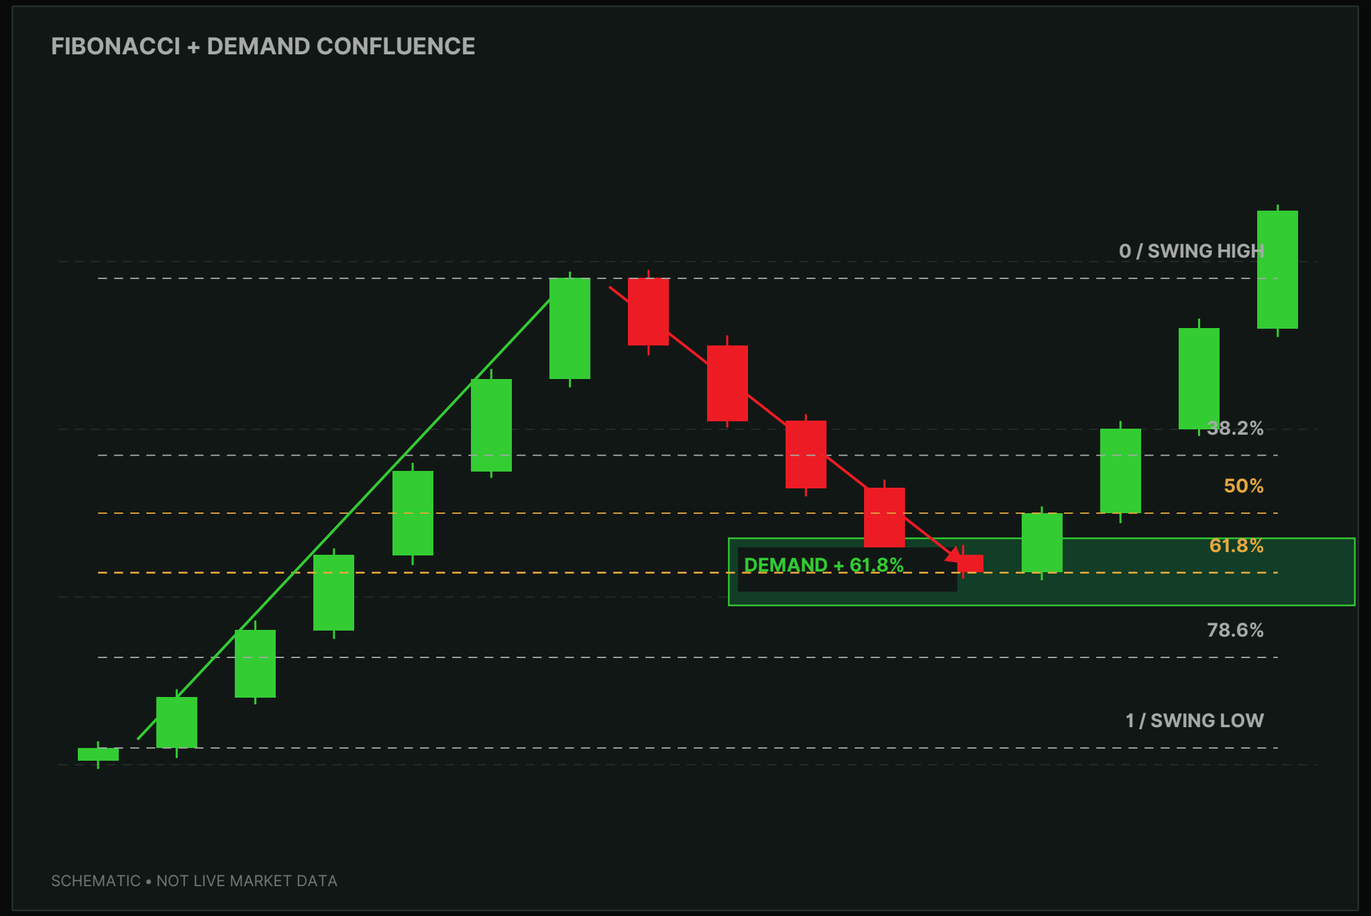

1. **Draw the swing**
   For the bullish example, drag from swing low to swing high when the retracement begins.

2. **Watch retracements**
   The source names 38.2%, 50%, 61.8% and 78.6%; its worked example reacts around 61.8%.

3. **Wait for the retest**
   The source avoids entering on the first bounce alone and prefers the level to align with demand and confirmation.

4. **Plan the target**
   The source illustration uses the −27% extension; treat this as an example to test, not a universal target.

CONFLUENCE ADDS EVIDENCE. IT DOES NOT REMOVE UNCERTAINTY.

RISK BEFORE REWARD

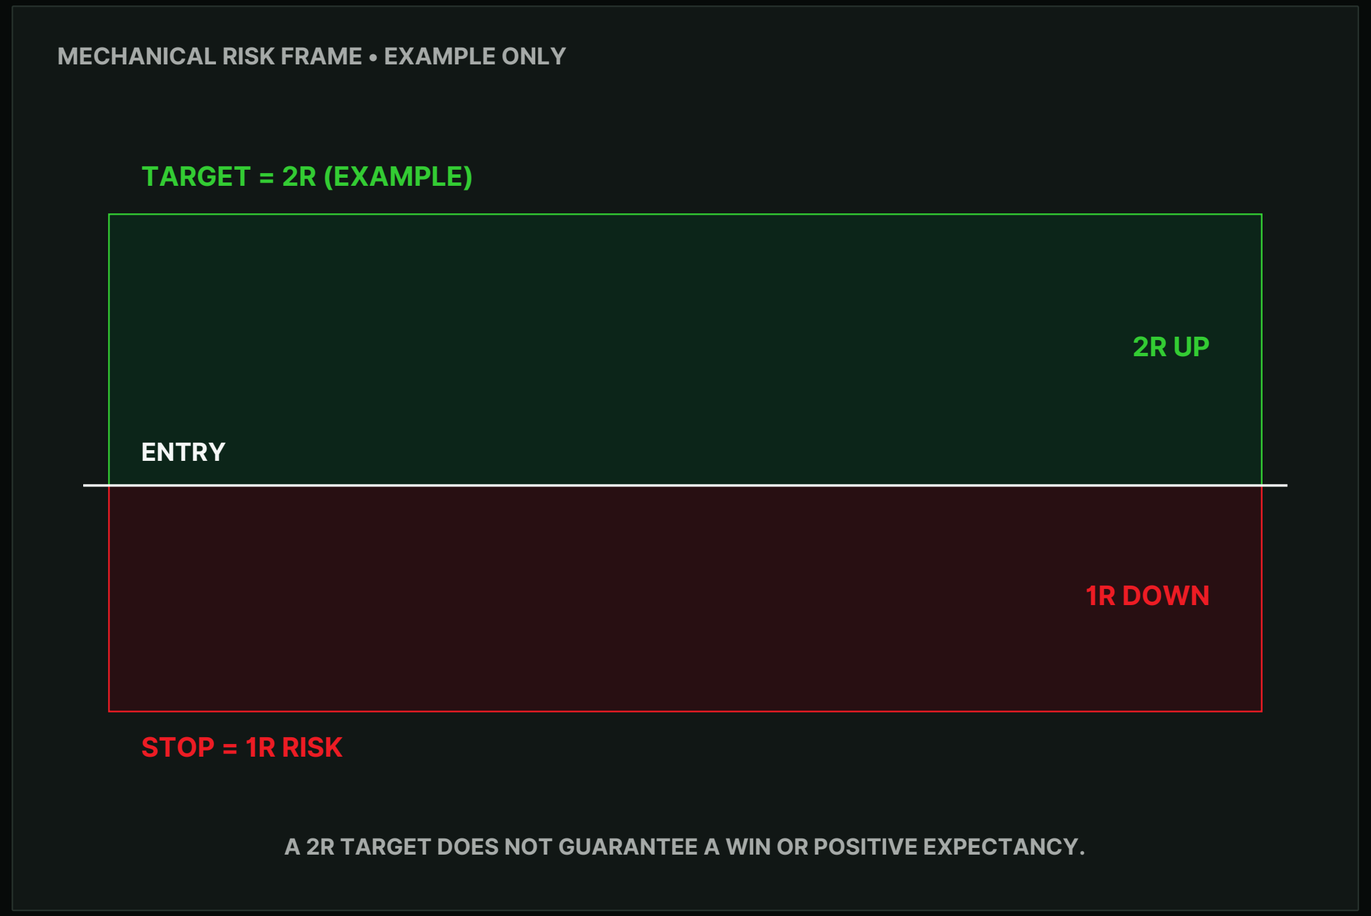

Confidence in a setup must never become permission for uncontrolled exposure.

1. **Set a fixed risk limit**
   Choose the maximum percentage or cash risk before the entry and calculate size from the stop.

2. **Do not improvise size**
   The source discusses 1% normally and 2% for a high-confluence example; this deck does not treat that as a recommendation.

3. **Measure the full sample**
   A single winning example says nothing about expectancy. Journal many setups, including losses.

A BETTER-STORY SETUP CAN STILL LOSE. RISK IS THE PART YOU CAN CONTROL.

YOUR SUPPLY & DEMAND CHECKLIST

A compact routine for the course's complete workflow.

Momentum

Was there a decisive departure or valid rejection pattern?

Zone

Did I mark the correct origin, consolidation or wick area?

Retest

Has price returned to the area without invalidating it?

Confirmation

Did rejection receive directional follow-through?

Confluence

Does any Fibonacci level add preplanned evidence?

Risk

Are stop, target, size and maximum loss fixed?

KEY TAKEAWAY

Rinse and repeat the checklist — not a trade taken from memory of one winning example.

JOREEM

TRADE WITH JOREEM
LEARNING SERIES

WAIT FOR THE MARKET TO SHOW YOU.

The course's strongest habit is patience: mark the area, let price return, require evidence and define the risk before acting.

1. **Mark**
   Use one of the three repeatable zone methods.
2. **Confirm**
   Do not confuse a zone touch with a valid trigger.
3. **Review**
   Journal the setup and its rule adherence, not just the result.

Trading can result in losses. These are schematic examples, not signals or performance claims. Test on demo, define risk in advance, and never trade money you cannot afford to lose.
