TRADE WITH JOREEM

JOREEM LEARNING SERIES • MASTERCLASS 01

ULTIMATE SUPPLY & DEMAND MASTERCLASS

Beginner to Pro • From market logic to top-down execution

30-SLIDE DECK | ZONE CHECKLISTS | PRACTICE PROMPTS

Understand the theory. Validate the zone. Align the timeframes. Plan the risk.

JOREEM

LEARN THE PROCESS.
RESPECT THE RISK.

EDUCATIONAL ONLY • TRADING INVOLVES RISK • NO RETURNS ARE GUARANTEED

YOUR BEGINNER-TO-PRO ROADMAP

Four connected layers — each one filters the decisions that follow.

01

Market logic & zones

Connect scarcity and pressure to demand, supply, discount and premium.

FOUNDATION

02

Trend & validation

Use market structure, imbalance and first-tap freshness to qualify a zone.

FILTER

03

Entries & confirmation

Choose between an extreme-zone limit and a lower-timeframe confirmation entry.

EXECUTION

04

Top-down range plans

Build the high-timeframe narrative, then use opposing zones for entries and targets.

INTEGRATION

KEY TAKEAWAY Do not start with an entry. Start with context, then earn the right to execute.

PART 01 • FOUNDATIONS

What supply and demand mean — and how a zone is drawn.

01

THE LOGIC BEHIND THE ZONES

PRESSURE LEAVES A FOOTPRINT

A zone marks where buying or selling pressure previously became strong enough to drive price away.

1. Understand scarcity and price
2. Separate indecision from impulse
3. Mark the full high-to-low range

THEORY → FOOTPRINT → TRADABLE AREA

WHY PRICE MOVES

The transcript begins with a simple economic chain, using gold as its example.

1. **Demand rises**
   More buyers compete for the available asset.

2. **Available supply falls**
   Buying removes readily available units from the market.

3. **Scarcity supports price**
   A scarcer asset can command a higher price; the reverse applies when supply expands.

CORE IDEA: PRICE RESPONDS TO THE BALANCE BETWEEN AVAILABLE SUPPLY AND DEMAND.

FROM ECONOMICS TO TRADABLE ZONES

Zones identify where pressure previously entered before a strong directional move.

DEMAND ZONE

A base or indecision area before a large upward move.

1. **Pressure**
   Buying pressure overcame available supply.
2. **Location**
   The area is treated as a potential discount region.
3. **Plan**
   Look for buying only when the wider context agrees.

SUPPLY ZONE

A base or indecision area before a large downward move.

1. **Pressure**
   Selling pressure entered as demand declined.
2. **Location**
   The area is treated as a potential premium region.
3. **Plan**
   Look for selling only when the wider context agrees.

KEY TAKEAWAY

The zone is a decision area — not a guarantee that the same orders remain.

THE BUILDING BLOCK: INDECISION + IMPULSE

The source uses the last candle before the impulse — regardless of its colour.

1 **Indecision candle**

A relatively small body and visible wicks show rejected prices and limited progress.

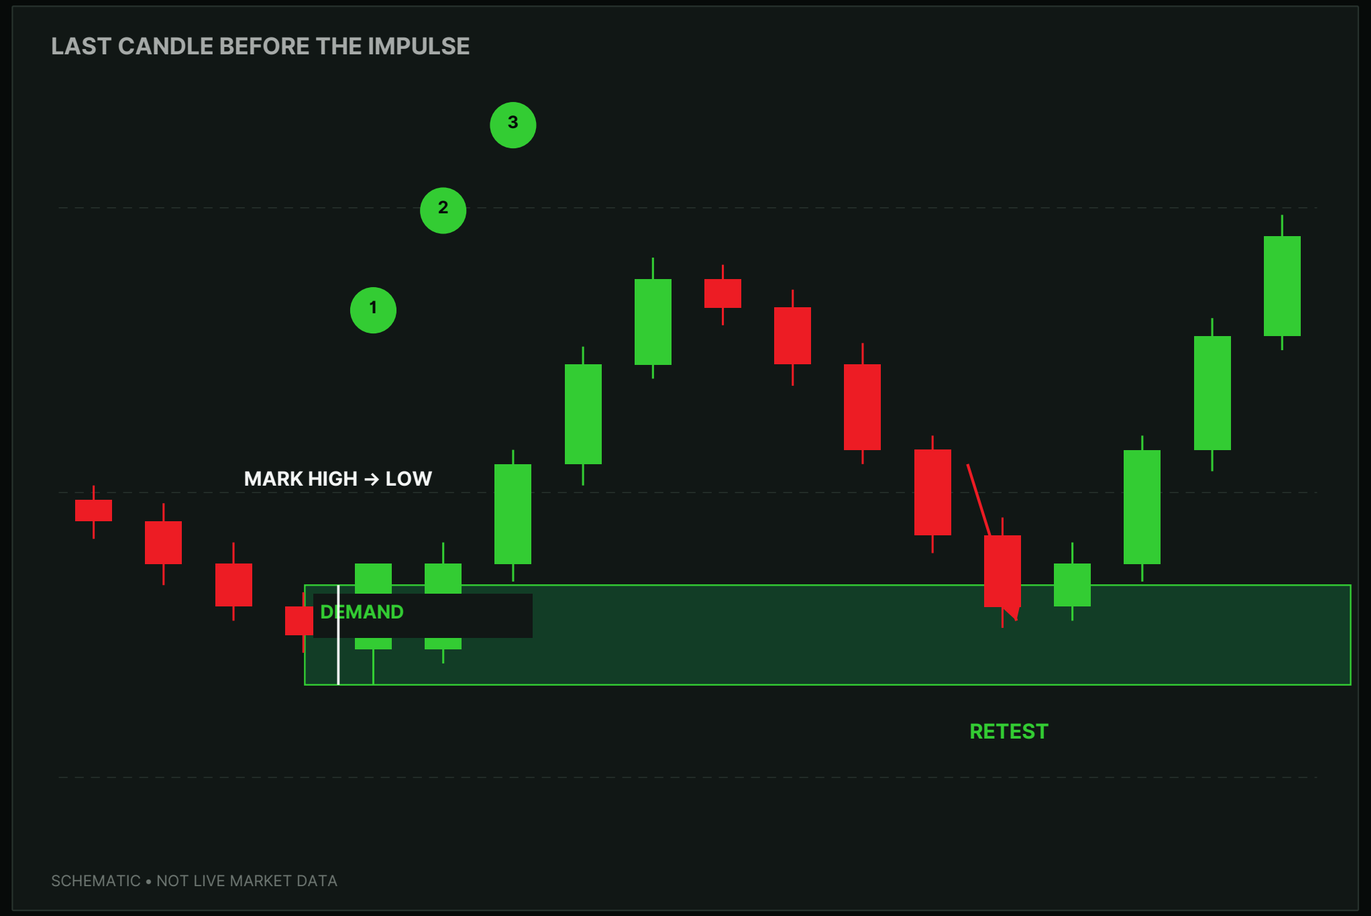

2 **Impulsive move**

One or more strong candles show clear directional control.

3 **The source rule**

Use the final indecision candle immediately before that impulse, not simply the last opposite-colour candle.

THE BASE SHOWS PAUSE. THE IMPULSE SHOWS WHO TAKES CONTROL.

DRAW THE ZONE – HIGH TO LOW

Include the wicks, then project the area to the right.

01

Find the departure

Locate a clear impulsive move away from a pause or base.

02

Select the last candle

Use the final indecision candle before the impulse.

03

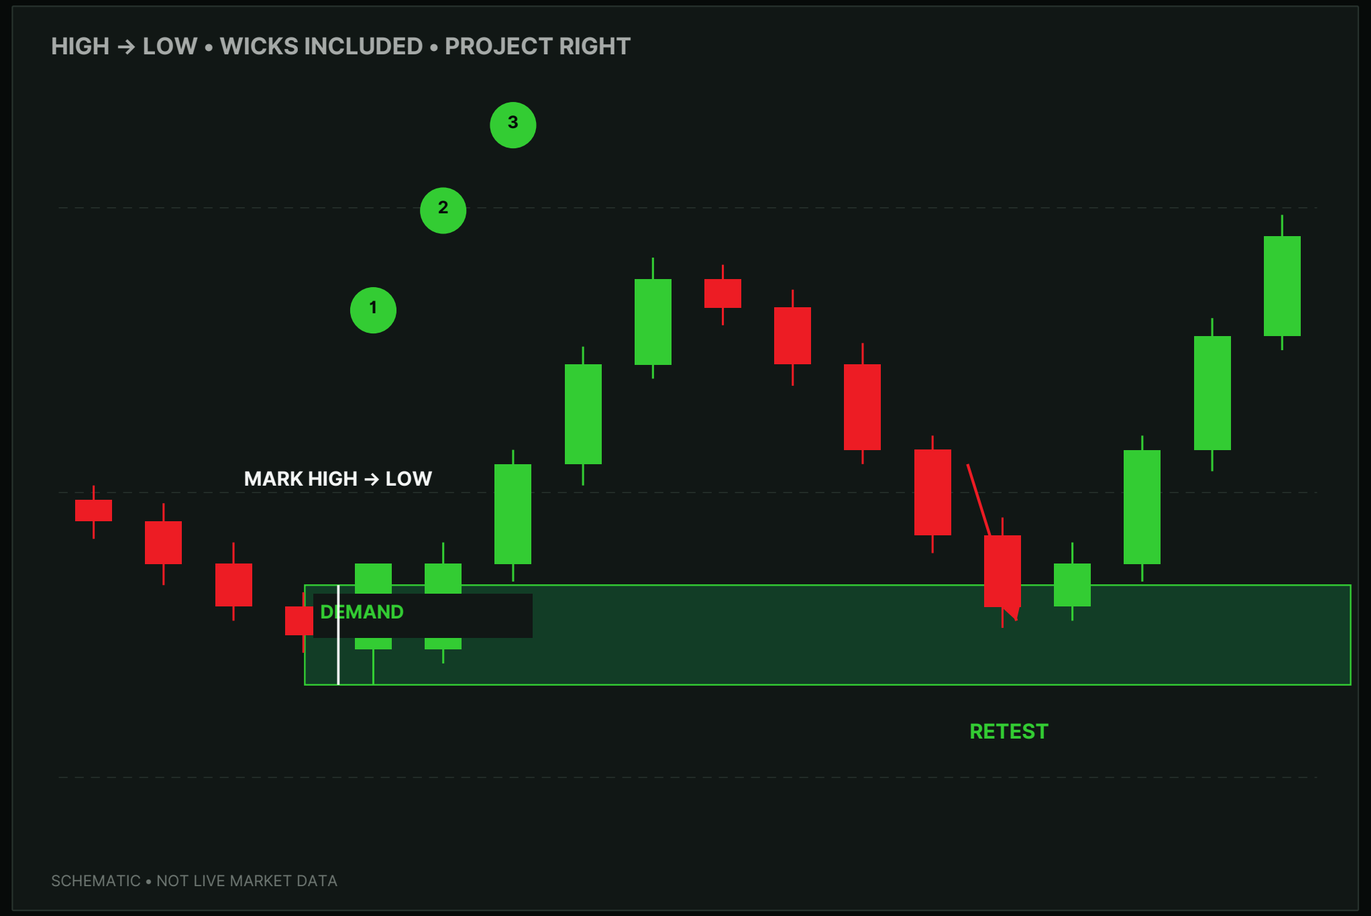

Mark the complete range

Draw from that candle's high to its low, including wicks.

04

Extend and wait

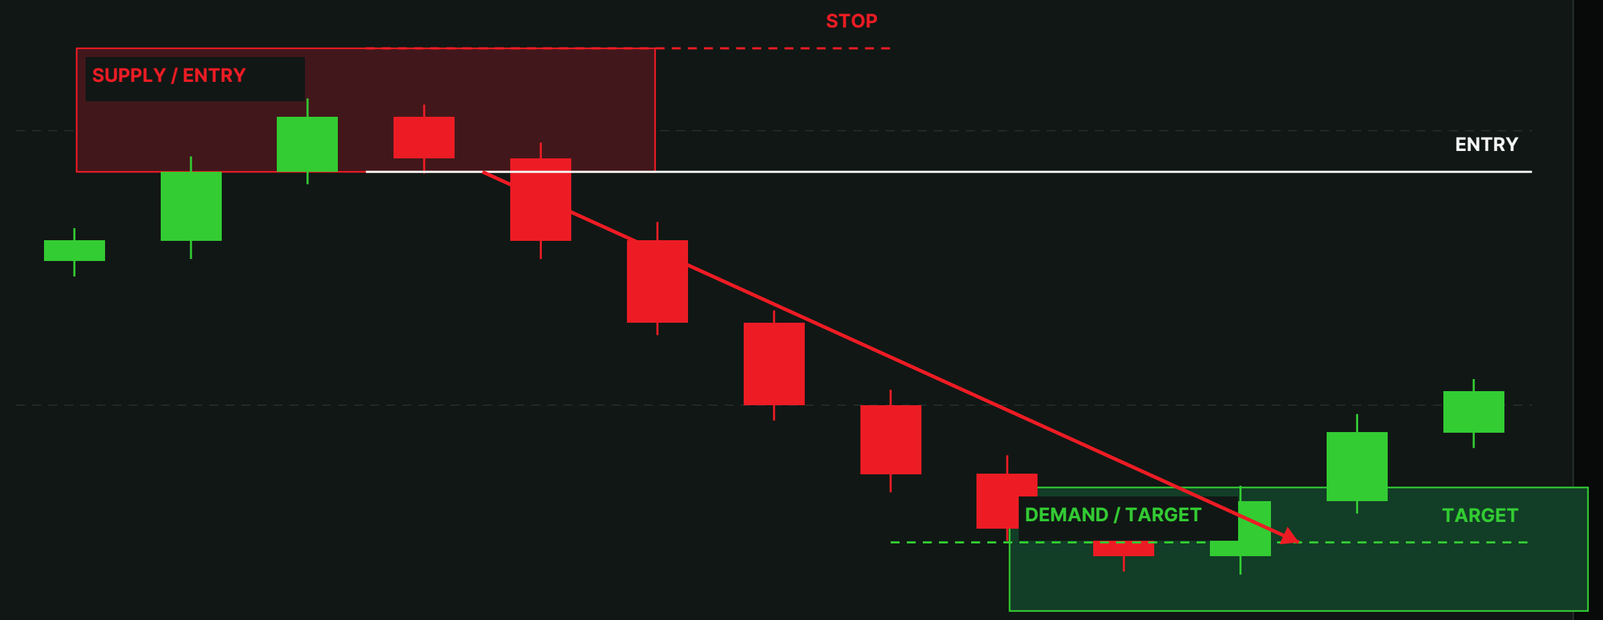

Project right. If relevant, include the immediately following wick extreme as shown in the source.

A SIMPLE SUPPLY-TO-TARGET EXAMPLE

The first trade model in the transcript: return to supply, sell, target a new low.

SELL FROM SUPPLY WITH DEFINED INVALIDATION

SCHEMATIC • NOT LIVE MARKET DATA

SCHEMATIC PLAN

CONTEXT	Downtrend
ENTRY	Supply return
STOP	Above zone
TARGET	Prior / new low
STATUS	Example only

Later lessons add trend, imbalance and freshness filters. Do not isolate this simple example from those rules.

PART 02 • CONTEXT & VALIDATION

A visible zone is not automatically a tradable zone.

02

FILTER BEFORE YOU EXECUTE

CONTEXT BEATS A PRETTY RECTANGLE

The masterclass repeatedly returns to three tests: trade with structure, require imbalance, and respect the first retest.

1. Read highs and lows objectively
2. Reject already-efficient areas
3. Avoid overused zones

TREND • IMBALANCE • FIRST TAP

MARKET STRUCTURE SETS DIRECTION

Use swings to classify the environment before selecting supply or demand.

1. **Uptrend**
   Higher highs and higher lows shift attention toward demand-zone buying.

2. **Downtrend**
   Lower lows and lower highs shift attention toward supply-zone selling.

3. **Structure shift**
   A break in the existing sequence can change which side of the market deserves focus.

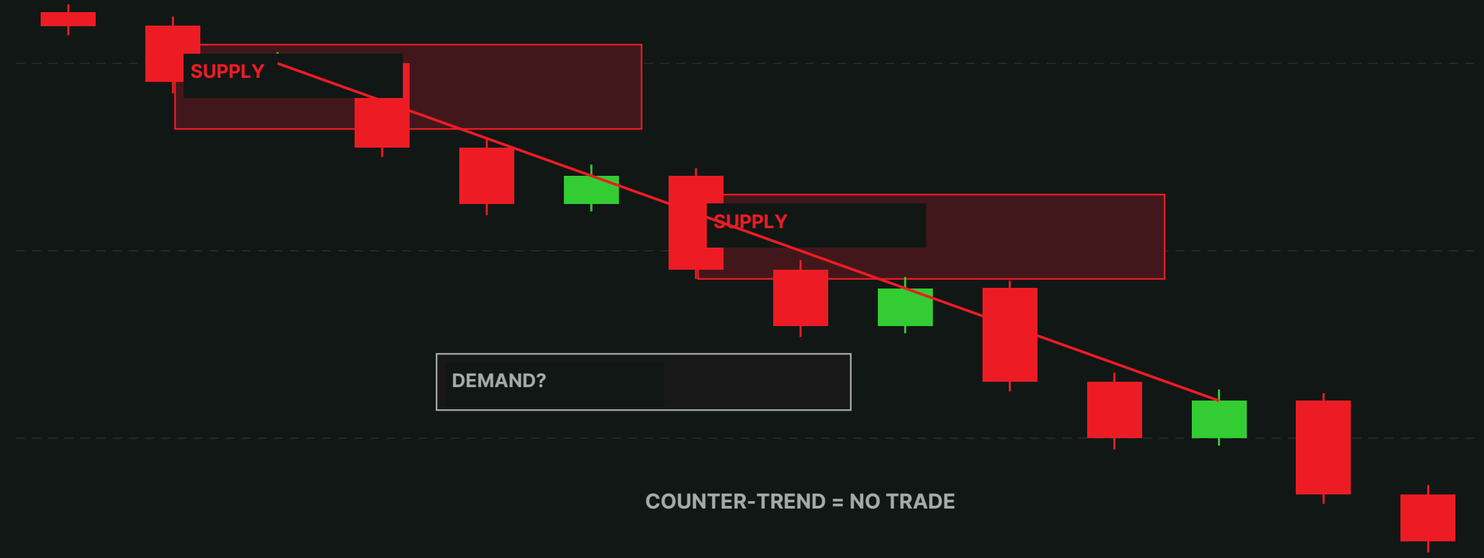

UPTREND: FOCUS ON DEMAND. DOWNTREND: FOCUS ON SUPPLY.

WHY COUNTER-TREND ZONES ARE FILTERED OUT

Zones appear everywhere; the source treats trend alignment as the first quality filter.

IN A DOWNTREND

1. **Prioritise**
   Fresh supply zones that agree with lower highs and lower lows.

2. **Ignore**
   Demand zones that require fighting the prevailing sequence.

3. **Reassess**
   Only after structure genuinely shifts — not merely because price looks cheap.

Filtering reduces trade frequency; it does not eliminate losses.

THE THREE-PART VALIDITY FILTER

A concise checklist drawn directly from the masterclass's recurring rules.

01

01 • Trend

Does the zone agree with the current high-timeframe structure and narrative?

DIRECTION

02

02 • Imbalance

Is there still an open, inefficient price range leading into the zone?

FRESH PATH

03

03 • First tap

Is this the first meaningful return, rather than the third, fourth or fifth?

FRESH ZONE

KEY TAKEAWAY If one core filter fails, the source treats the zone as lower probability or no trade.

IMBALANCE VS EFFICIENCY

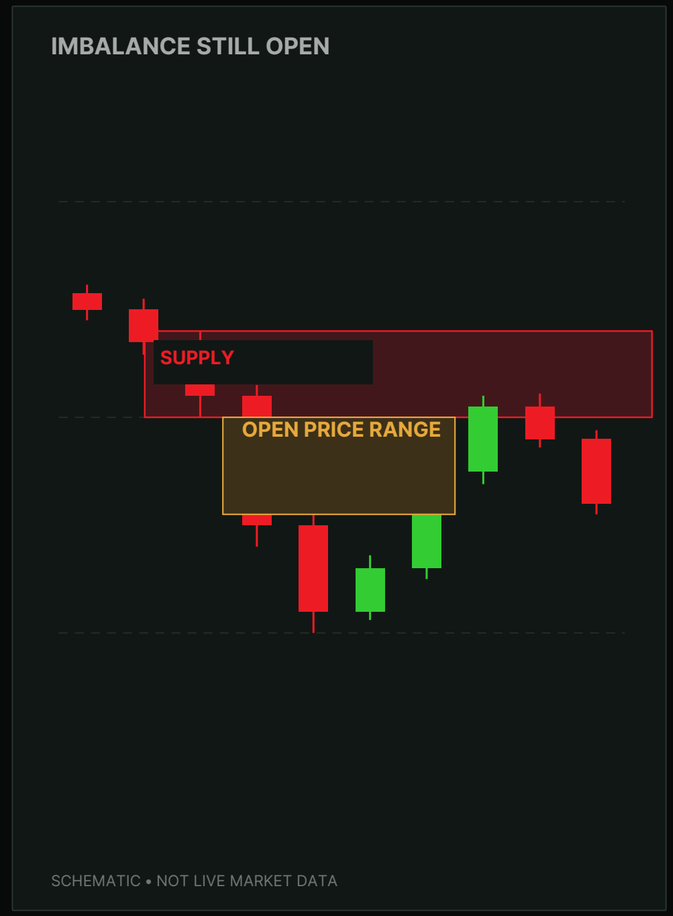

Look for an open price range whose wicks have not yet filled the area.

1. **Imbalance**
   An unfilled range remains between relevant wick extremes ahead of the zone.

2. **Efficiency**
   Later price trade has already filled that range; the original open path is gone.

3. **Why it matters**
   The source prefers the fresh imbalanced area and avoids zones whose imbalance has already been consumed.

NO IMBALANCE INTO THE ZONE = NO VALID ZONE IN THIS PLAYBOOK.

THE FIRST-TAP RULE

Repeated returns can consume resting interest and increase the chance of a break.

FRESHNESS CHECK

1. **First retest**
   The source's preferred opportunity after a valid departure.
2. **Later retests**
   Treat repeated taps as evidence that the zone is being used up.
3. **After a reaction**
   Move on and locate the next fresh, imbalanced zone.

Repeated failure of a zone can also reveal strength in the opposing direction.

PART 03 • ZONE SELECTION & ENTRIES

Choose the location, then choose how much confirmation you require.

03

FROM ANALYSIS TO EXECUTION

EXTREME FIRST. CONFIRM WHEN INTERNAL.

When several zones exist inside one leg, the source distinguishes the furthest fresh extreme zone from internal zones.

1. Map every fresh zone in the leg
2. Separate extreme from internal
3. Match entry style to location

LOCATION → ENTRY STYLE → INVALIDATION

SELECTING THE EXTREME ZONE

Within the current leg, the extreme is the furthest valid fresh zone from current price.

SELECTION LOGIC

1. **Start with freshness**
   Remove zones whose imbalance has already been filled.

2. **Find the extreme**
   Identify the final valid zone at the far end of the current leg.

3. **Treat internal differently**
   If using a closer internal zone, the source prefers lower-timeframe confirmation.

"Highest probability" in the transcript is a framework claim, not a measured win-rate guarantee.

LIMIT OR CONFIRMATION?

Both approaches are described in the source; each has a different trade-off.

EXTREME-ZONE LIMIT

A resting order at the furthest valid zone.

1. **Strength**
   Can capture a move that leaves without a lower-timeframe shift.
2. **Trade-off**
   Price can trade through the zone before any confirmation appears.
3. **Requirement**
   Predefined stop and a strong higher-timeframe location.

CONFIRMATION ENTRY

Wait for lower-timeframe structure to agree.

1. **Strength**
   No shift means no entry, which can avoid some failed zones.
2. **Trade-off**
   The market may leave without offering the pattern.
3. **Requirement**
   A clear shift plus a fractal supply or demand retest.

KEY TAKEAWAY

Missing a trade is acceptable. Forcing an entry without the required evidence is not.

THE BEARISH CONFIRMATION SEQUENCE

Use the lower timeframe to align execution with a bearish higher-timeframe narrative.

01

Reach higher-timeframe supply

Price enters the predefined area of interest.

02

Map the small bullish structure

Mark the short-term highs and higher lows inside the return.

03

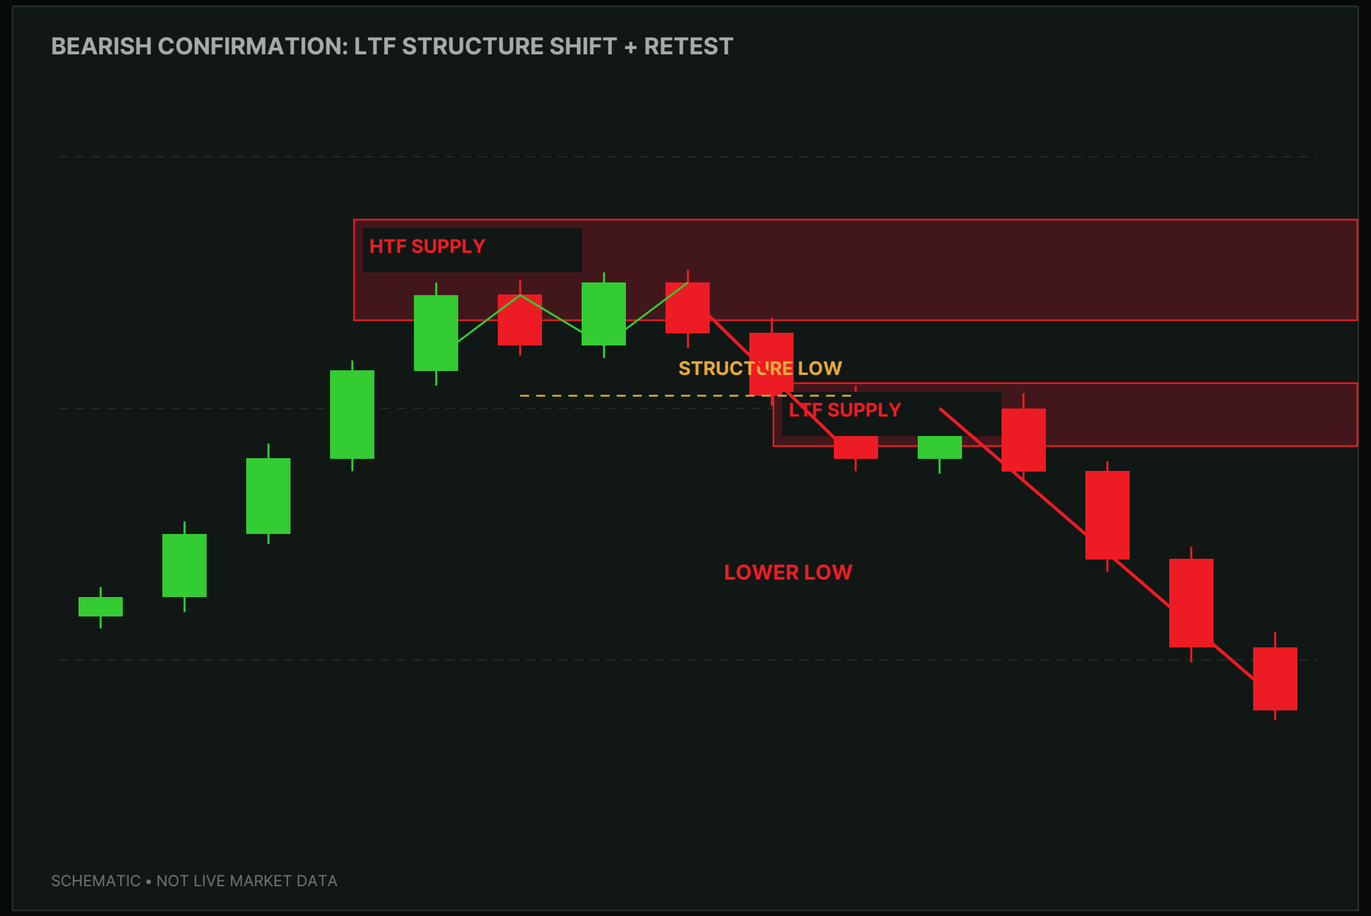

Wait for a bearish shift

A close below the relevant higher lows creates a lower low.

04

Sell the fractal supply retest

Use the last indecision candle before the bearish impulse; place invalidation above the confirmed structure.

THE BULLISH MIRROR

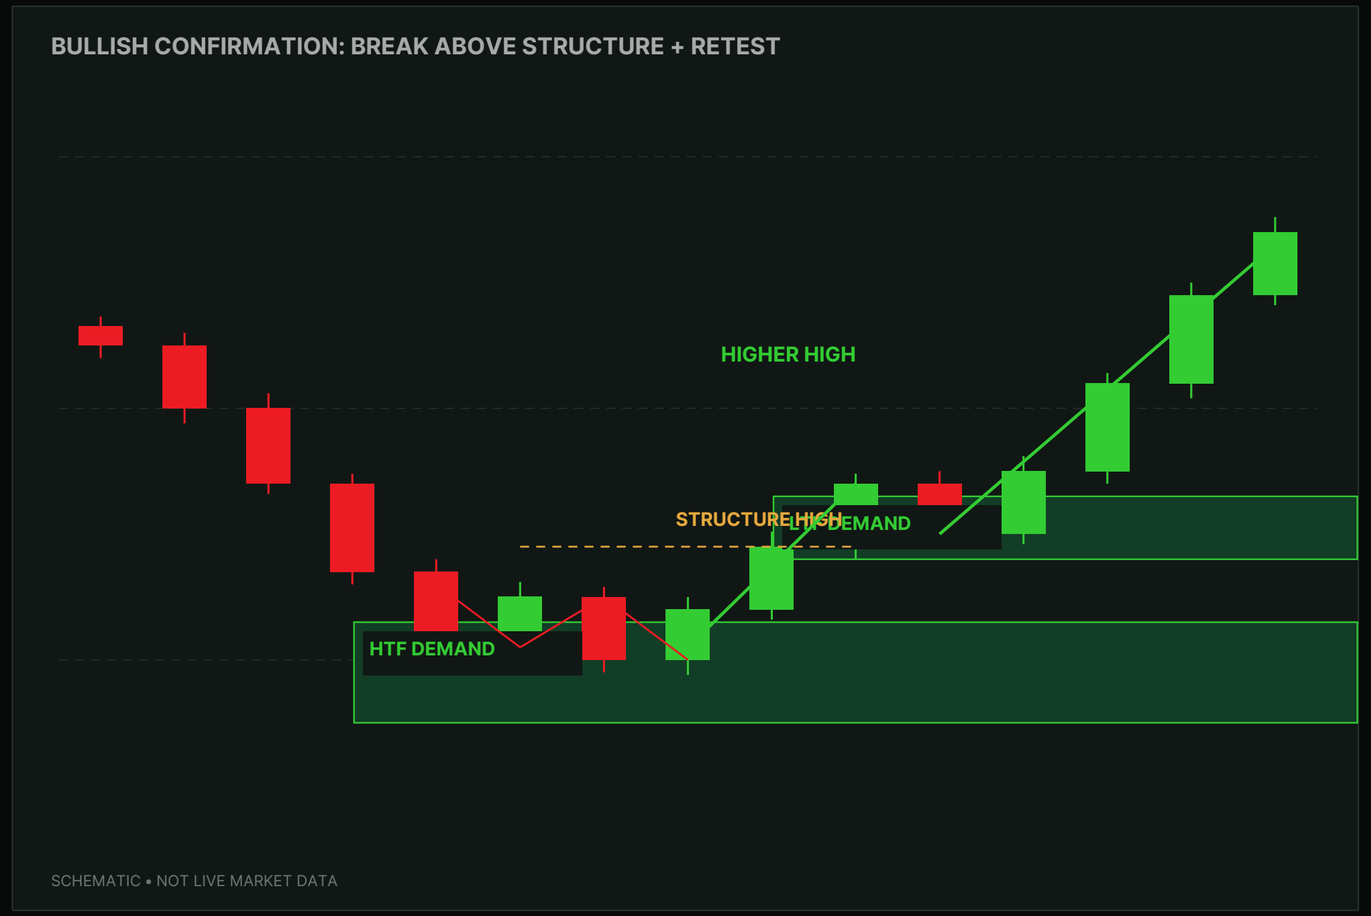

The same confirmation logic is inverted when demand and bullish structure agree.

1. **Higher-timeframe demand**
   Price returns to a valid area within a bullish narrative.

2. **Bullish break**
   Lower-timeframe price breaks above the relevant lower-high structure.

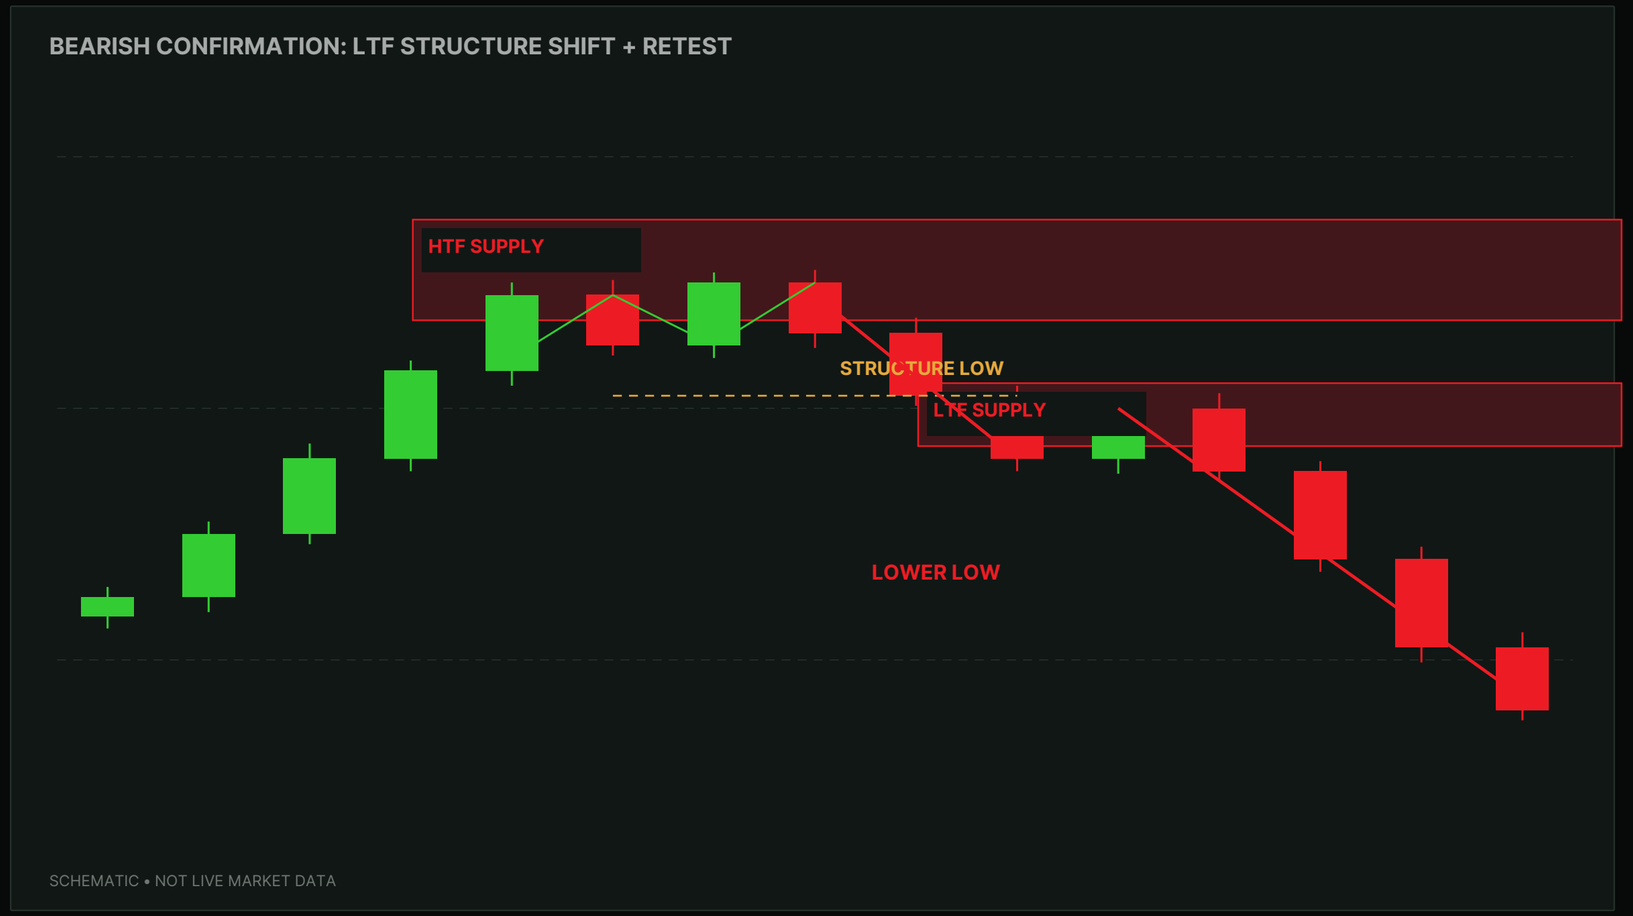

3. **Fractal demand retest**
   Use the last candle before the impulse that broke structure, with invalidation below the confirmed area.

BIG PICTURE BULLISH + SMALL PICTURE BULLISH = ALIGNED EXECUTION.

WORKED SHORT: TWO LAYERS OF CONFIRMATION

A higher-timeframe supply reaction followed by a lower-timeframe structural shift.

ALIGNED SHORT

HTF	Bearish
TRIGGER	LTF lower low
ENTRY	LTF supply
STOP	Above LTF high
TARGET	HTF low

If the shift never forms, the confirmation model produces no trade. The diagram is a process example, not a signal.

PART 04 • FRACTAL & TOP-DOWN

Use higher timeframes for narrative and lower timeframes for execution.

04

ONE LOGIC • MULTIPLE TIMEFRAMES

BUILD THE MAP BEFORE THE TRADE

Supply and demand can frame targets and entry locations on weekly, daily, intraday and lower-timeframe charts.

1. Recognise the fractal pattern
2. Mark high-timeframe ranges
3. Execute only with alignment

WEEKLY → DAILY / 4H → EXECUTION

THE FRACTAL PRINCIPLE

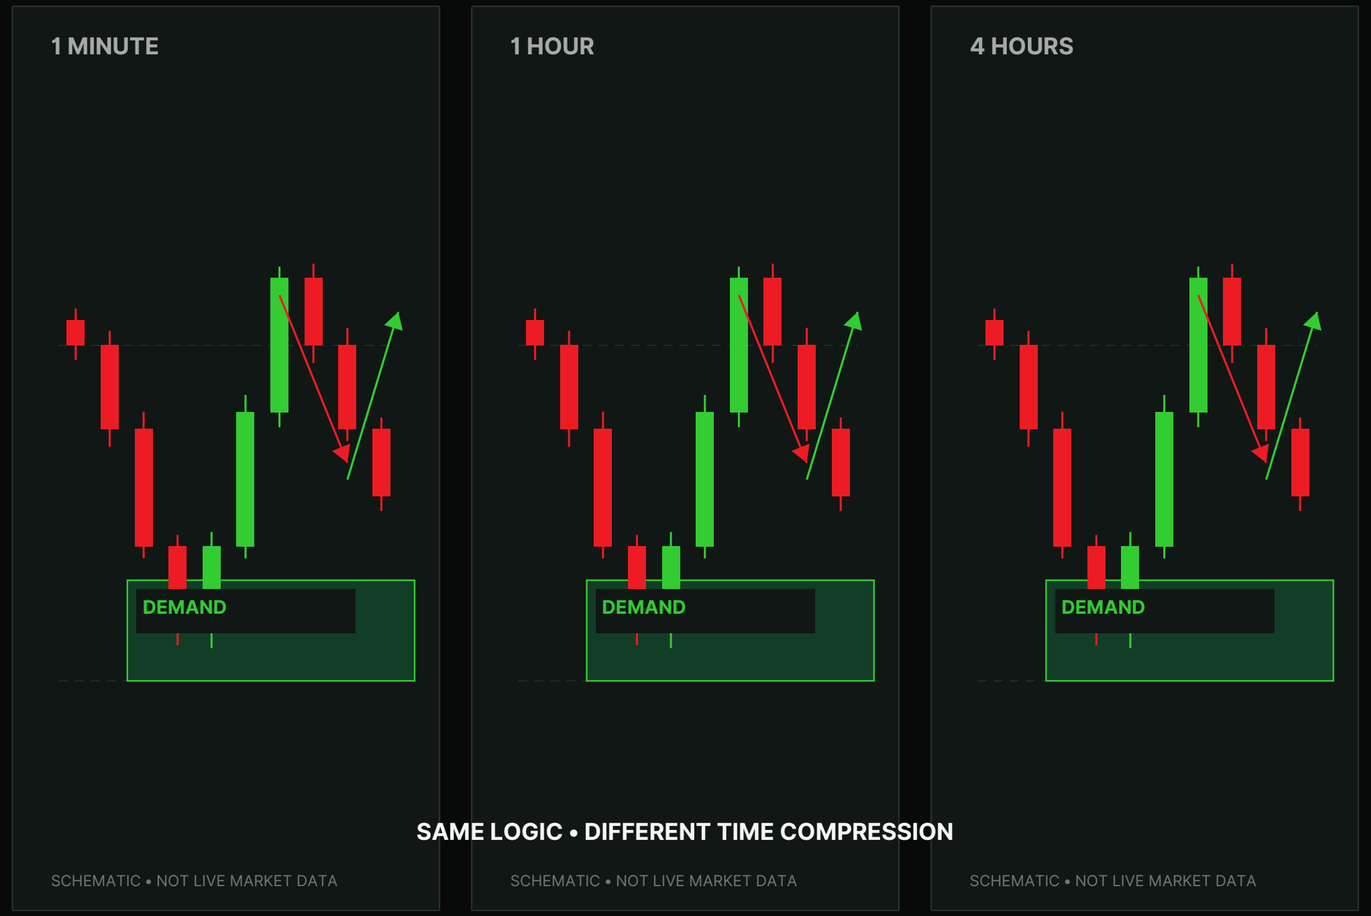

The same base–impulse–retest logic can appear at very different time compressions.

1. **Structure repeats**
   The transcript shows similar-looking zone behaviour on one-minute, one-hour and four-hour charts.

2. **Style changes, rules do not**
   Scalping, day trading and swing trading still require context and validation.

3. **Timeframe is a choice**
   There is no universal best timeframe; test a coherent top-down combination.

FRACTAL DOES NOT MEAN IDENTICAL RESULTS. IT MEANS REPEATING STRUCTURAL LOGIC.

SAME LOGIC • DIFFERENT TIME COMPRESSION

A PRACTICAL TOP-DOWN WORKFLOW

Use higher-timeframe supply and demand to create a map of where business may be done.

01

Build the weekly / daily narrative

Mark the broad structure and the next meaningful opposing zones.

02

Define range-to-range scenarios

Consider sells toward demand or buys toward supply only when the narrative supports them.

03

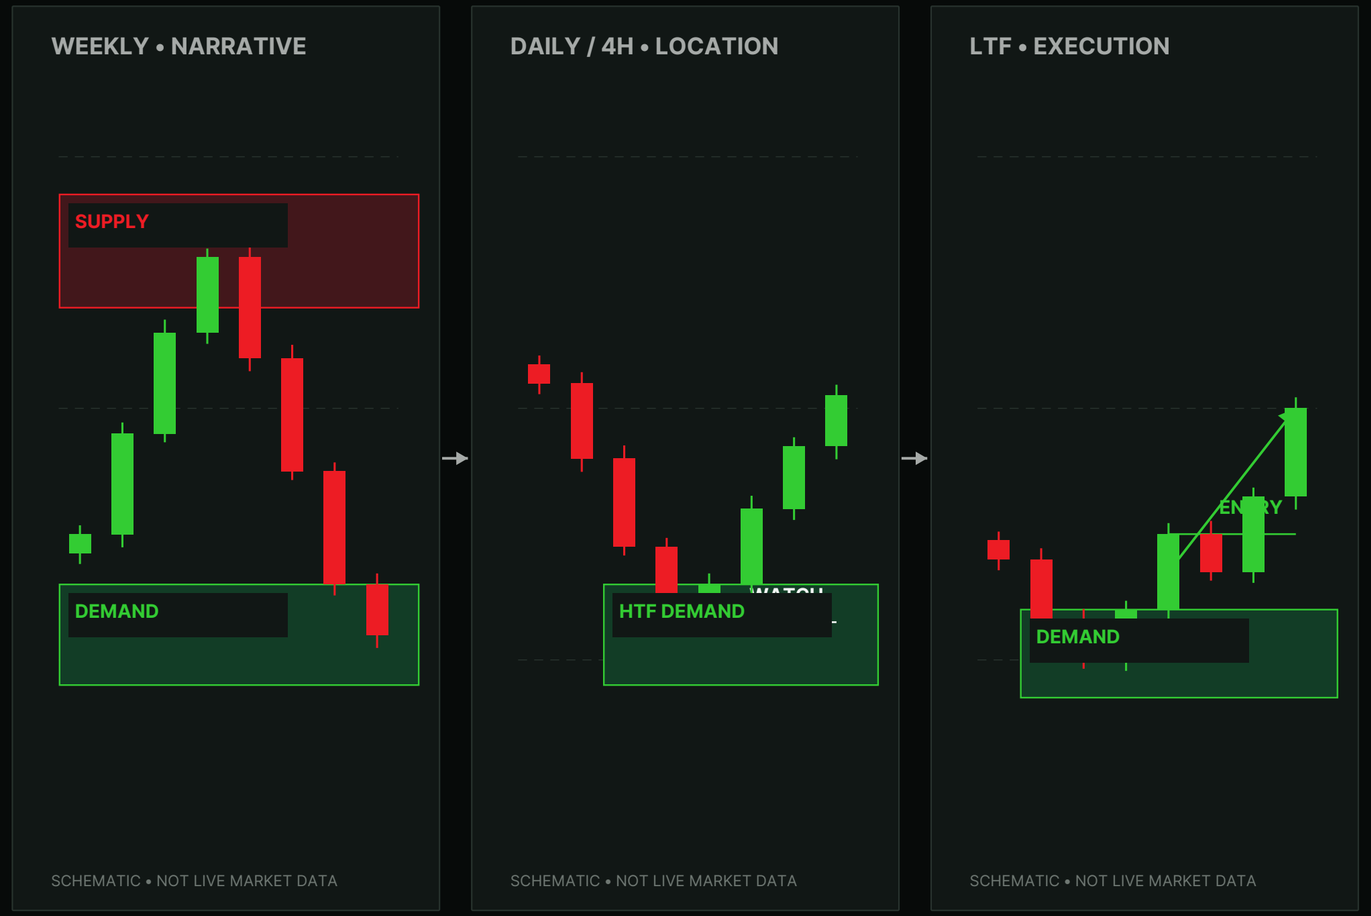

Refine on daily / 4H / lower

Look for the pullback, fresh zone or structural shift that fits the map.

04

Execute and target deliberately

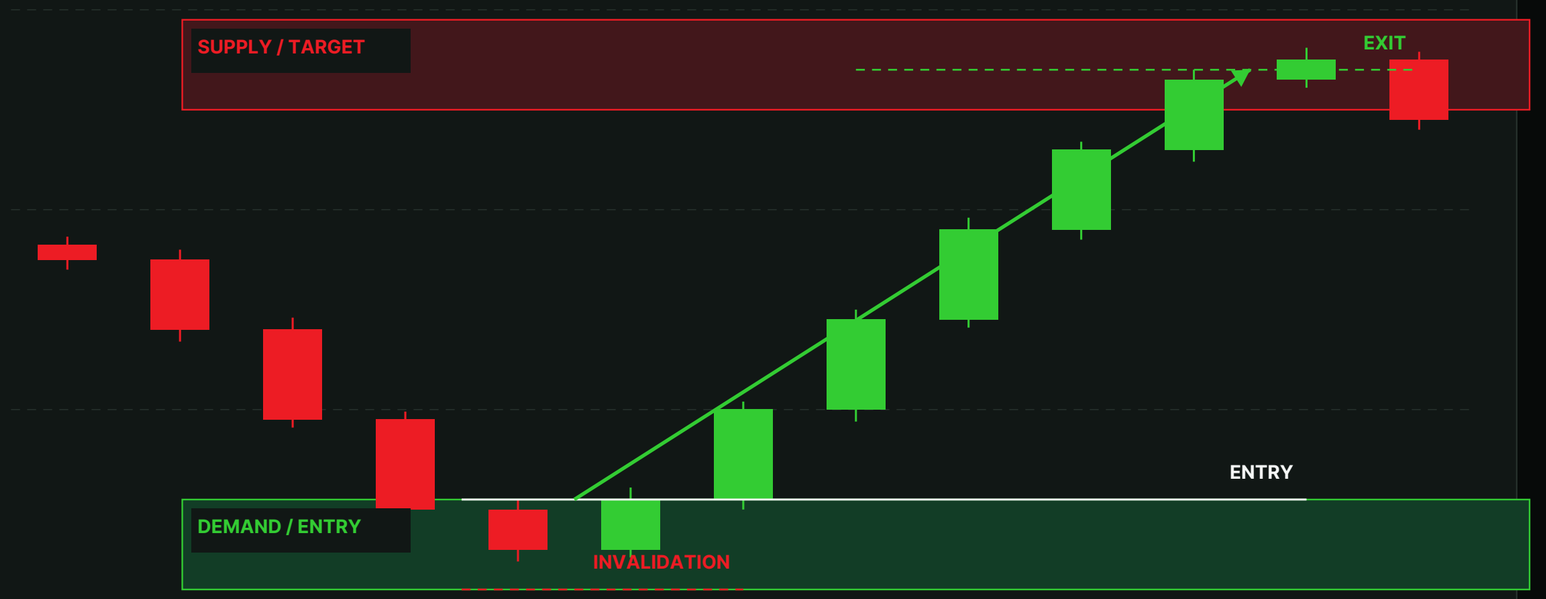

Use the lower timeframe for entry and the opposing high-timeframe area as a potential target.

ZONES ARE FOR TARGETS, TOO

Opposing supply or demand can define a logical place to exit, not only a place to enter.

TRADE FROM ONE OPPOSING ZONE TO THE OTHER

SCHEMATIC • NOT LIVE MARKET DATA

RANGE LOGIC

1. **Entry side**
   A fresh extreme zone with no unfilled obstacle immediately behind it.

2. **Target side**
   The opposing zone where opposing pressure previously appeared.

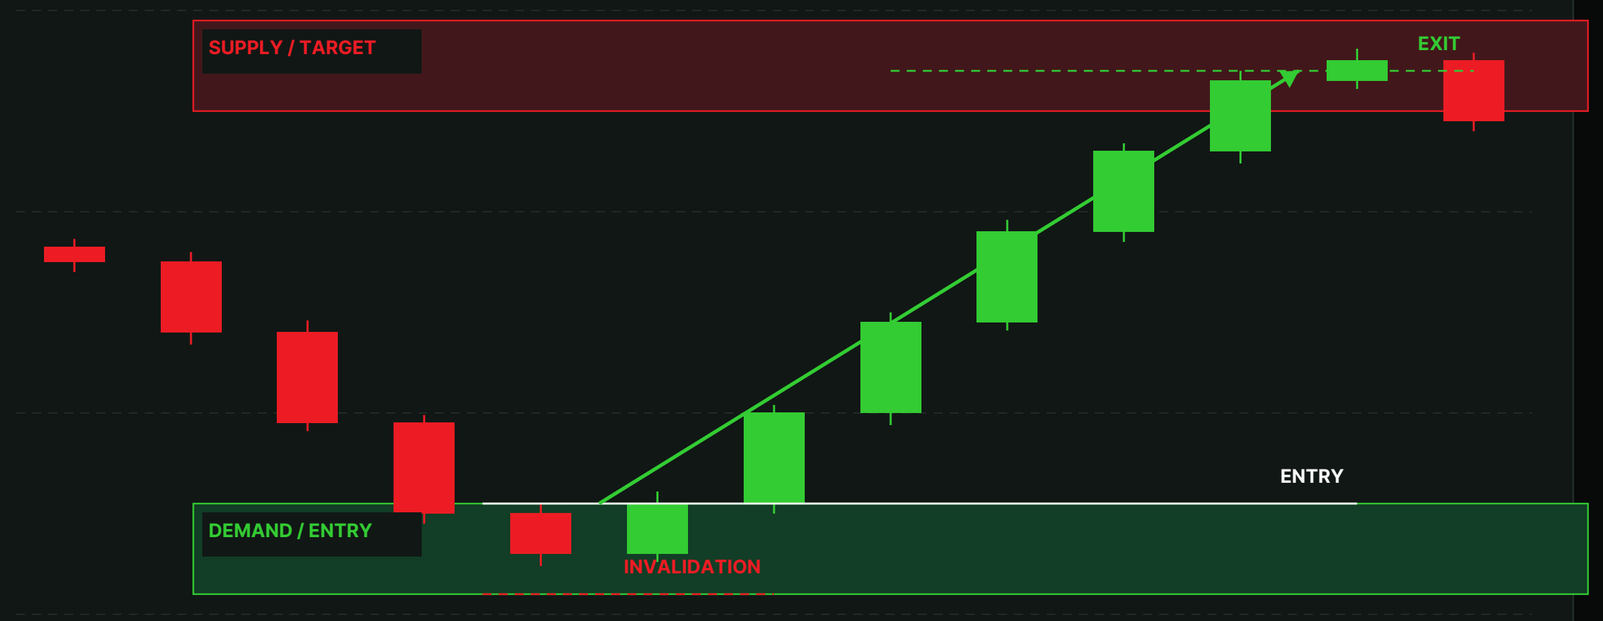

3. **Benefit**
   A defined range can avoid holding through a reversal immediately beyond the opposing zone.

Price can break through either zone. A target is a plan, not a promise.

DEMAND-TO-SUPPLY RANGE PLAN

The transcript's two-minute example is reframed as a clean, testable planning template.

TRADE FROM ONE OPPOSING ZONE TO THE OTHER

SCHEMATIC • NOT LIVE MARKET DATA

RANGE TICKET

ENTRY	Extreme demand
STOP	Below demand
TARGET	Fresh supply
SOURCE R	1:5 illustration
EXPECTANCY	Unknown

The 1:5 figure is an illustrative source example, not an expected return or a reason to ignore invalidation.

COMMON FAILURE MODES

Most errors in the transcript come from ignoring context or continuing to use old information.

01

Fighting structure

Buying every visible demand zone inside a clear downtrend — or doing the reverse in an uptrend.

FILTER WITH TREND

02

Using filled zones

Treating an efficient, already-traded range as if its original imbalance were still available.

CHECK FRESHNESS

03

Selling repeated taps

Returning to the same supply or demand area after several reactions.

MOVE TO THE NEXT ZONE

04

Forcing confirmation

Drawing a structural shift that is not really there because you do not want to miss the move.

NO PATTERN = NO TRADE

KEY TAKEAWAY A disciplined no-trade is a valid outcome of the analysis.

THE COMPLETE PRE-TRADE WORKFLOW

Compress the masterclass into one repeatable sequence.

01

1 • Establish direction

Classify structure and write the higher-timeframe narrative.

02

2 • Qualify location

Require a fresh zone, remaining imbalance and a first-tap opportunity.

03

3 • Select the zone

Prefer the valid extreme; treat internal zones as confirmation-only in this framework.

04

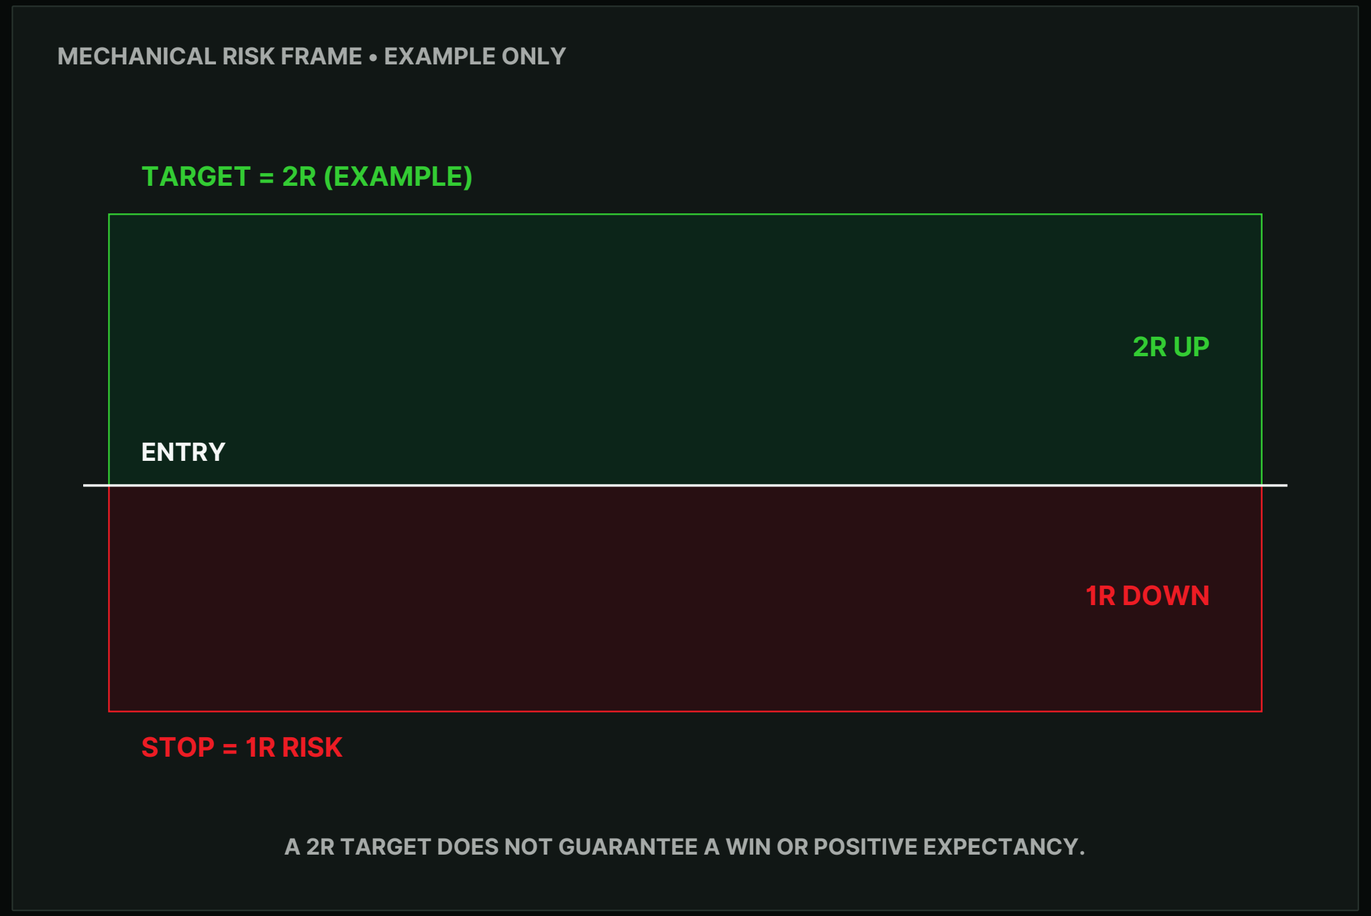

4 • Choose the trigger

Use a planned extreme limit or wait for lower-timeframe alignment.

05

5 • Define risk and exit

Set invalidation beyond the relevant structure and target the opposing area or planned objective.

MASTERCLASS CHEAT SHEET

Six questions to answer before any supply or demand trade.

Trend

Am I trading with the prevailing structure?

Zone

Is it the last indecision candle before a real impulse?

Imbalance

Is the open range still unfilled?

First tap

Is this the first meaningful return?

Trigger

Does my chosen limit or confirmation model exist?

Risk

Are stop, target and maximum loss defined?

KEY TAKEAWAY

When the answers are unclear, the next action is to wait — not to widen the rules.

PRACTISE THE PROCESS, NOT THE OUTCOME

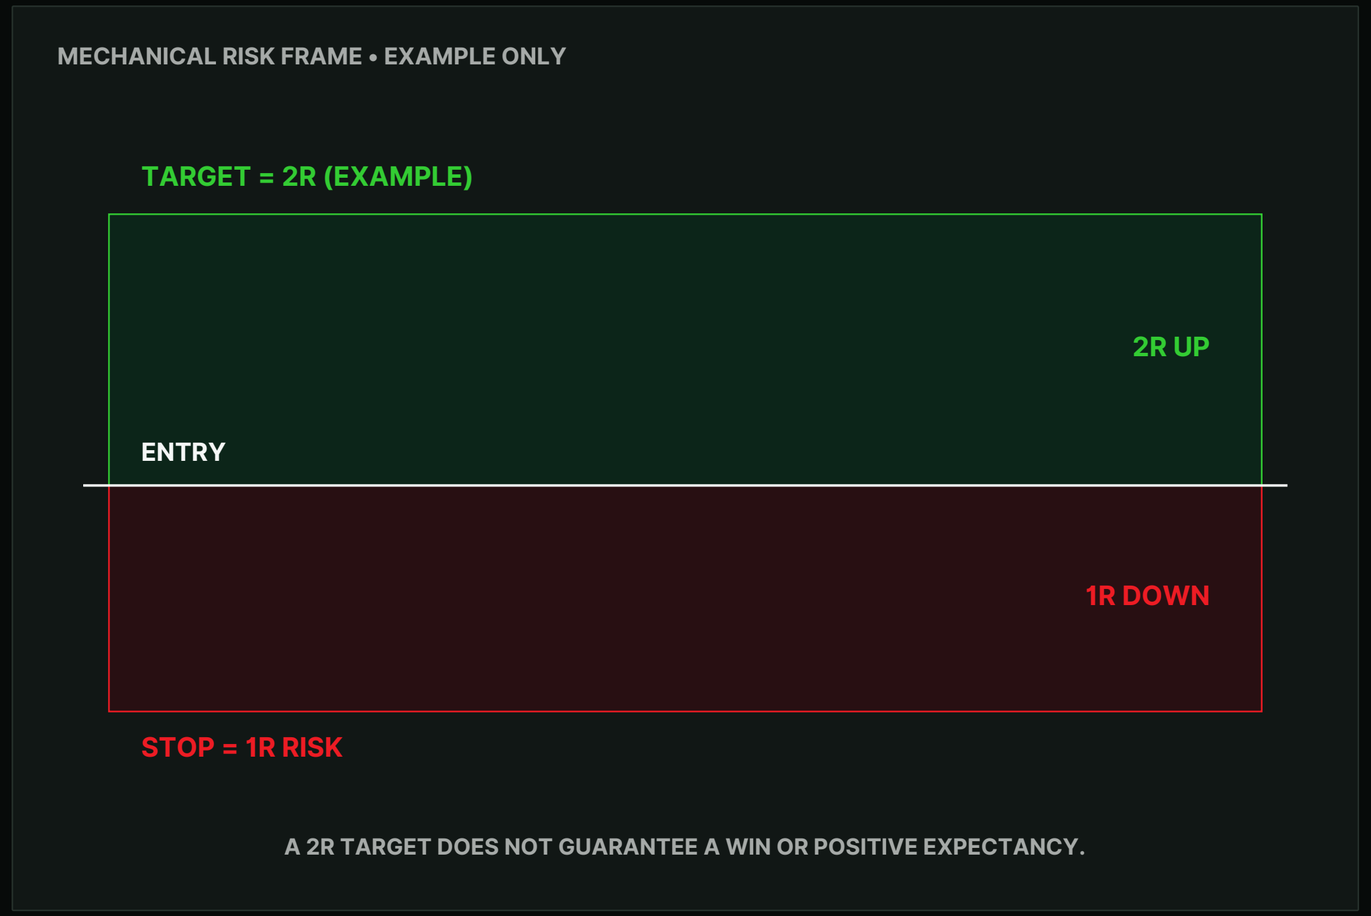

Turn the framework into evidence you can review and improve.

1. **Replay one setup family**
   Mark trend, zone, imbalance and first tap before moving price forward.

2. **Record the decision**
   Screenshot the narrative, trigger, invalidation and opposing-zone target.

3. **Review a sample, not one win**
   Use a journal to measure rule adherence and outcomes across many examples.

NO SETUP IS COMPLETE WITHOUT A POINT AT WHICH THE IDEA IS WRONG.

JOREEM

TRADE WITH JOREEM
LEARNING SERIES

MASTER THE MAP. THEN WAIT.

The edge of this masterclass is not a rectangle. It is the ordered process that decides which rectangles deserve attention.

1. **Context first**
   Trend and high-timeframe narrative before location.
2. **Freshness second**
   Imbalance and first tap before entry.
3. **Risk always**
   Invalidation, target and maximum loss before execution.

Trading can result in losses. These are schematic examples, not signals or performance claims. Test on demo, define risk in advance, and never trade money you cannot afford to lose.
